

If your product contains any kind of chemical, the retailer participants in wercsmart require for it to be registered.

Even if your product is organic, all-natural, or does not contain any harmful or hazardous chemicals, it still needs to be registered via wercsmart.

Products which currently do not require registration are clothing or food (unless dispensed via aerosol or bag-on-valve methods).

The best source for verification on whether your product needs to be registered is your retailer buyer.

The retailer will determine the parameters of registration per supplier.

The following types of products are required for registration. This list is not all-inclusive, so you are encouraged to verify the registration requirement with your buyer:

All chemical-containing products

Over-the-counter pharmaceutical products and nutritional supplements

Personal care products

Products powered by a battery

Products which contain a circuit board or electronics

Lightbulbs

Food products dispensed by aerosol or bag-on-valve method

Cooking oil

Kits or Gift Packs are a compilation of products under one UPC, which is then sold to the consumer.

The chemical-containing products within a Kit need to be registered and submitted separately. Once the individual product registration is complete, you may then select the product to include in the Kit you will create for UPC registration.

A tutorial is available for the creation and registration of Kits using the Tutorial menu link above.

End-Caps, if they are all the same product within, may not be required for registration, as the individual product is already registered. You may verify this with your Buyer before setting up the End-Cap as a kit product registration.
